
perfect plan
sufficient compute
perfect knowledge
Priviledged Teacher
close to optimal control input
Expensive Control Approach with Perfect Knowledge
field of view
perfect environmental context
Priviledged Teacher Control Framework
varying Information length and occlusions
field of view
independence of long context and memory
noisy measurements
noisy reference
noisy context
filter and extract relevant information
unknown environments
generalizability to unseen environments
hardware deployablity
fast reaction time under limited compute
nearly perfect plan via imitation
limited compute
imperfect knowledge
Student with Imperfect Knowledge
close to optimal control input via imitation
Memory capable NN
Inexpensive Control Approach with Learned Cost Parameter
imperfect perceived context information
Student Controller with Imperfect Knowledge
Vision-Based Challenges
Requirements
